APPENDIX 11: SAMPLES OF GUIDES TO TEST INTERPRETATION
Alaska

Comprehensive System of Student Assessment (CSSA)

Guide to Test Interpretation for the Grade 8 Science Standards Based Assessment

For Teachers and Staff

Spring 2013
**Introduction**

This Guide to Test Interpretation provides an overview of reporting for the Alaska Grade 8 Science Standards Based Assessment (SBA). It is intended to help educators interpret test report data in order to better meet the needs of individual students and the district as a whole. The following information is included in this guide:

**Table of Contents**

*Explanation of Examinations and Scoring* ........................................................................................................1

Explanation of Examinations and Scoring

The Purpose of Testing

The purpose of the Standards Based Assessment (SBA) is to (a) determine on a statewide basis the extent to which students are meeting statewide performance standards; (b) produce statewide information that enables sound decision making by policy makers, parents, educators, and the public; and (c) provide a focus in order to improve instruction [4 AAC 06.700].

The Alaska Standards Based Assessment (SBA) is the result of intense effort and collaboration among teachers, administrators, and the Alaska State Board of Education. The proficient score on the examination was designed to reflect what students should know as a result of their public school experience.

How Results are Measured

Students are tested on the Alaska Performance Standards/Grade Level Expectations (PSGLEs) in science. The PSGLEs are aligned to the Alaska Content Standards and are statements that define what all students should know and be able to do at the end of a given grade level. Each Performance Standard/Grade Level Expectation is meant to further define a content standard. Alaska teachers developed the PSGLEs for Alaska students. For detailed information on the standards, please access the Department of Education & Early Development (EED) publication, *Alaska Standards: Content and Performance Standards for Alaska Students* available on the EED website at: http://education.alaska.gov/standards/.

The Purpose and Usefulness of Raw Scores and Scale Scores

Raw Score

The primary indicator of performance on the science SBA is the raw score. A raw score is reported for each examinee in science. The raw score is the number of multiple-choice items answered correctly plus the number of points earned on short- and extended-response items on the science SBA. By itself, the raw score has limited utility; it can only be interpreted in reference to the total number of items on the science SBA. Raw scores cannot be compared across tests or administrations.

Scale Score

Since a given raw score may not represent the same skill level on every test form, all statewide assessment score reports include scale scores. Scale scores are statistical conversions of raw scores that adjust for slight shifts in item difficulties and permit valid comparison across all test administrations within a particular subject. The scale score range for the science SBA is from a minimum of 100 to a maximum of 600.
When new test forms are developed, the new items will require slightly different levels of subject-area skill to answer correctly. This depends on the difficulty of the specific questions used on each form. To be fair to students, to permit valid comparison of test scores across administrations, and to maintain a consistent passing score, the skills represented by each score point must remain consistent from year to year.

As noted previously, scale scores adjust for slight shifts in underlying difficulty levels at each score point and provide valid points of comparison across all test administrations within a particular grade and subject. With scale scores, schools can compare the demonstrated knowledge and ability of different cohorts across years. Comparing scale scores on the assessments can help schools determine the impact of instruction and curriculum.

**Scale Score Interpretations and Limitations**

The scale scores associated with the science SBA are not equated with other grade 8 SBA examinations, even though they share a common scale score range. Therefore, interpretation of individual score differences between the assessments is inappropriate.

**Components of the Science SBA**

The science SBA was developed from a variety of written sources, and assesses the students’ skills in the areas of: inquiry, technology, nature of science, physical science, life science, and earth science. The science SBA contains multiple-choice questions with four possible answer choices. These answers are machine-scored. Short- and extended-response questions allow students the opportunity to create a response to meaningful situations to demonstrate their knowledge and skill. Responses are scored by professional staff experienced in providing reliable and consistent hand scoring. Questions requiring a written response allow for full or partial credit.
Frequently Asked Questions

* This illustration is not based on the current administration.

Question:

In 8th grade science, the maximum overall scale score is 600. However, the four maximum subject/standard scale scores are 600, 600, 535, and 534. How can these four numbers combine into a higher number (600) than two of the four numbers?

Answer:

It is necessary to understand the relationship between raw scores and scale scores to appreciate the seeming anomaly.

Range:

Two things, the number of items and the difficulty of the items that make up a standard, determine the range of possible scale scores.

- The longer the test, the wider the range of scale scores.
- The easier the test, the lower the maximum scale score.

- For any given person, the raw score for the total test is the sum of the raw scores for the standards, BUT the total scale score is not the sum, nor the average of the standard scale scores.
- There is no mathematical relationship between the average of the scale scores for the standards and the average overall scale score.
**Impact of hard and easy items:**

The relationship between raw scores and scale scores is designed to eliminate the effect of taking a hard test or an easy test, or the fact that the items from one standard may be easier than the items from another standard.

- Students would need fewer correct responses on a “harder” standard to achieve the same scale score they would get by having more correct responses on an “easier” standard.

  **OR**

- Answering 70% of the items correctly on a “harder” standard represents a higher level of ability than answering 70% of the items correctly on an “easier” standard.

- The raw score to scale score conversion levels the playing field, removing the impact of harder items or easier items in a given standard.

- The total test scale score is not a simple average of the standard scale scores.

  - The relationship is much too complex to be described by an average that ignores the number of items in each test and the average difficulty of the items making up that standard.

**Question:**

Is it possible for a student to answer all of the items correctly in a standard and not get the highest possible scale score (600)?

**Answer:**

Yes.

- A perfect score in a standard with easier items will translate into a lower scale score than a perfect score in a standard with harder items.
  - Both maximum scores may be less than the maximum score for the overall test.
    - This is due to the distribution of item difficulties and the number of items.
    - It is easier to answer 11 of 11 items correctly in a single standard than it is to answer 64 of 64 items correctly on the entire test.
      - The scale score for answering all of the items correctly on a standard will necessarily represent less ability than answering all of the items correctly on the overall test.
      - Although the scale score span goes from 100 to 600, it does not mean it is possible to get the highest or lowest scale score on every standard or even the overall test.
Using Results

The science SBA results and reports provide useful information for determining the performance of students in your school and classroom. This guide will also help you prepare for questions from parents, students, and other members of the education community regarding the science SBA results.

Each report is designed to clearly present the information most useful to you and to parents and students. The audience and student populations for each of the science SBA reports are listed below.

Sample Reports

STANDARDS SKILL PERFORMANCE

This report provides a record of Your Student’s test results on the science SBA.

Proficiency Levels

The science SBA is designed to measure how well students have learned the standard and skills against state standards. Scores on these tests are grouped into four proficiency levels. The chart on the right shows scale score ranges associated with each level. Typical characteristics for the given proficiency levels can be found at http://education.alaska.gov.

Scale Score

The scale score earned by the student determines the student’s performance level of proficient or not proficient on the science SBA. The points earned are converted into a scale score that takes into consideration the fact that some items that make up a scale score are more difficult than others. Therefore, a student can earn the same raw score on two standards and end up with two different scale scores. For this reason, you cannot divide the points earned by the points possible for a standard to derive the scale score.

Skills Performance

Science is composed of different skills. The chart on the right shows how your student did on these skills.

Interpretation of Chart

Scale scores are represented by the diamond (♦). For each subject, the chart displays the proficient cut score lies within the possible scale score range (100 – 600). Scores in the shaded area indicate not proficient, whereas scores in the non-shaded area indicate proficient.

For example, Your Student’s scale score in Science is 361. Note that the diamond representing this score falls in the Advanced scale score range. If your student were to take a similar test multiple times, the range of these scores would fall between 330 and 385 (as represented by the line) 85% of the time.

* SAMPLE REPORT: This sample report is not based on the current administration.
Student Report (continued)

A. Presents student demographics.

B. Indicates the student’s scale score and proficiency level in science. In order to be considered proficient, the student must score at or above the Alaska Proficient Scale Score.

C. Describes the proficiency levels reported in section B. Scores on the science SBA are grouped into four proficiency levels.

D. Describes the scale scores reported in section B. The scale score earned by the student determines the student’s performance level of advanced, proficient, below proficient, or far below proficient on the science SBA. The points earned are converted into a scale score that takes into consideration the fact that some items that make up a standard on the test are more difficult than others. Therefore, a student can earn the same raw score on two standards and end up with two different scale scores. For this reason, you cannot divide the points earned by the points possible for a standard to derive the scale score.

E. Lists the Performance Standard categories.

F. Lists the total points possible for the Performance Standard categories.

G. Lists the points earned by the student for the Performance Standards on the science SBA. Points earned are not valid for comparisons across grades, and/or standards. The same raw score on two standards usually results in two different scale scores depending on the number of questions and the difficulty of the questions. For this reason, you cannot divide the points earned by the points possible to determine meaningful percentages.

H. Lists the scale score equivalent for points earned.

I. Explains the information found in the probable scale score range chart (J).

J. Graphically illustrates the student’s scale score (♦), the student’s 80% confidence interval for Performance Standards and total test, and the proficiency cut score for the total test.

K. Describes the skills necessary for a student to be proficient, along with the range of scale scores associated with each level.
## Student Scale Score Information

This report includes summary information for each student within a school. The report lists students alphabetically.

* SAMPLE REPORT: This sample report is not based on the current administration.
School Student Roster (continued)

This report includes summary information for each student within a school. The report lists students alphabetically by ascending grade.

A Indicates the proficient scale scores for the science SBA.

B Indicates the average scale score on the science SBA, as well as the average scale score by Performance Standard category for the state, district, and school. It also lists the proficiency level and scale scores in science for each student reported to the school.

C Indicates the state average scale scores for the science SBA and Performance Standards.

D Indicates the district average scale scores for the science SBA and Performance Standards.

E Indicates the school average scale scores for the science SBA and Performance Standards.

F Indicates the proficiency level and scale score by test and Performance Standard for each student reported to the school. This section may also indicate why a student did not receive a score.

- ABS = absent
- INV = invalid
- MOD = modified examination*
- NOA = test not attempted
- PRF = parent refusal
- SRF = student refusal
- SUS = suspension

*Students with disabilities cannot be denied the modification(s) their IEP teams have documented, but students can refuse the modification(s). NOTE: Modified tests are invalid and will not be scored.
School Summary Report (continued)

This report provides an analysis of group standards mastery using the average scale score obtained for each reportable standard and details for the percent of students in each proficiency level.

A. Explains the comparison of proficiency levels.

B. Lists the total points possible for the science SBA and the Performance Standard categories, as well as the average points earned for the school. It also lists the state, district, and school average scale scores for the science SBA and the Performance Standard categories.

C. Lists the points possible for the science SBA and Performance Standard categories.

D. Lists the average points earned and average scale score at the school level for the science SBA and Performance Standard categories.

E. Lists the average scale score at the district level for the science SBA and Performance Standard categories.

F. Lists the average scale score at the state level for the science SBA and Performance Standard categories.

G. Lists the total number and percent of students tested, as well as the number and percent of students who were advanced, proficient, below proficient, and far below proficient in science at the school, district, and state levels.

Note: Students who were coded absent, invalid, modified, parent refusal, student refusal, or suspension, as well as students who did not attempt the test, are not included in the summarization of results for this report.
## School Subpopulation Summary Report

District School Roster (continued)

This report includes summary information for each school alphabetically within a district.

A  Explains the comparison of proficiency levels.

B  Indicates the average scale score for the science SBA, as well as the average scale score by Performance Standard category for the state, district, and all schools in the district.

C  Indicates the number of students tested in the state, as well as the state average scale scores for the science SBA and Performance Standards.

D  Indicates the number of students tested in the district, as well as the district average scale scores for the science SBA and Performance Standards.

E  Indicates the number of students tested in each school, as well as the school average scale scores for the science SBA and Performance Standards.

Note: Students who were coded absent, invalid, modified, parent refusal, student refusal, or suspension, as well as students who did not attempt the test, are not included in the summarization of results for this report.
**SAMPLE REPORT:** This sample report is not based on the current administration.

This report provides details for the percent of students in each proficiency level in grade 8.

A Lists the total number and percent of students tested, as well as the number and percent of students who were advanced, proficient, below proficient, and far below proficient in science in a variety of demographic reporting categories at the district level.
Science SBA Grade 8 Proficiency Level Descriptors

Advanced Level

The student

- displays a highly developed conceptual understanding by applying experimental design processes to investigations
- examines scientific inquiry
- explains nature of science concepts
- analyzes and evaluates differing scientific explanations and models
- explains and compares the structure and properties of matter
- describes transformations, transfers and conservation of energy
- draws conclusions about the interactions between forces, motion, energy, and matter
- explains the structure, function, behavior, development, life cycles, and diversity of living organisms, their changes over time, and their relationships within environments
- describes features of Earth
- interprets and compares the geochemical cycles, changes, and interactions between Earth and the solar system

Proficient Level

The student

- demonstrates a basic conceptual understanding by incorporating methods of experimental design into investigations
- applies scientific inquiry
- demonstrates nature of science concepts
- analyzes differing scientific explanations and models
- differentiates among the structure and properties of matter
- identifies transformations, transfers and conservation of energy and describes the interactions between forces, motion, energy, and matter
- recognizes the structure, function, behavior, development, life cycles, and diversity of living organisms, their change over time, and changes within environments
- identifies features of Earth
- explains geochemical cycles, changes, and interactions between Earth and the solar system
Science (continued)

Below Proficient Level

The student

- shows a fundamental understanding by recognizing experimental design processes in an investigation
- identifies components of scientific inquiry
- describes nature of science concepts
- recognizes and describes differing scientific explanations and models
- recognizes the structure and properties of matter
- recognizes that energy can be transformed, transferred and conserved
- recognizes the nature of forces, motion, energy, and matter
- identifies the basic biology of living organisms in the environment
- recognizes features of Earth
- identifies geochemical cycles, changes, and interactions between Earth and the solar system

Far Below Proficient Level

There is a significant need for additional instructional opportunities to achieve the proficient level.
Glossary

**Constructed-Response Question**
An assessment unit with directions, a question, or a problem that elicits a written, pictorial, or graphic response from a student. Sometimes called an “open-ended” item.

**Content Standard**
Broad statements of what students should know and be able to do as a result of their public school experience.

**Forms**
Different versions of a test that measure the same subject area.

**Item**
One of the assessment units, usually a problem or a question, in a test.

**Mean**
An average, calculated by adding the values of a set of scores and dividing by the number of scores in the set.

**Multiple-Choice Question**
A question or incomplete statement that is followed by answer choices, one of which is the correct or best answer.

**Performance Standard**
A statement that defines what all students should know and be able to do at the end of a given grade level.

**Proficiency Level**
Category that reflects a range of test scores that represents a student’s current acquired knowledge and skills in the subject area.

**Scale Score**
Three-digit number that provides a common metric for expressing student performance from different forms.

**Standard Error of Measurement**
A mathematical calculation that estimates a range within which a student’s “true score” would fall, had that student taken the test numerous times. It is important to understand that all tests have an inherent measurement error because they are a sample of student performance at one particular time.

**Standardized Test**
A test administered in accordance with explicit directions for uniform administration.
Explanation of Examinations and Scoring

The Purpose of Testing
The purpose of the Standards Based Assessment (SBA) is to (a) determine on a statewide basis the extent to which students are meeting statewide performance standards; (b) produce statewide information that enables sound decision making by policy makers, parents, educators, and the public; and (c) provide a focus in order to improve instruction [4 AAC 06.700].

What the Science SBA Measures
The science component of the Standards Based Assessment (SBA) measures what students know and are able to do at their grade level in science as compared to the Alaska Performance Standards/Grade Level Expectations. For detailed information on the standards, please access the Department of Education & Early Development (EED) publication, Alaska Standards: Content and Performance Standards for Alaska Students available on the EED website at: http://education.alaska.gov/standards/.

Components of the Science SBA
The science SBA was developed from a variety of written sources, and assesses the students’ skills in the areas of: inquiry, technology, nature of science, physical science, life science, and earth science. The science SBA contains multiple-choice questions with four possible answer choices. These answers are machine-scored. Short- and extended-response questions allow students the opportunity to create a response to meaningful situations to demonstrate their knowledge and skill. Responses are scored by professional staff experienced in providing reliable and consistent hand scoring. Questions requiring a written response allow for full or partial credit.

**STANDARDS SKILL PERFORMANCE**

*This report provides a record of your student's test results on the science SBA.*

**Proficiency Levels**

The science SBA is designed to measure knowledge and skills against state standards. Scores on these tests are grouped into four proficiency levels. The proficiency level chart shows the scale score ranges associated with each level. Typical characteristics for the proficiency levels can be found at [http://education.alaska.gov](http://education.alaska.gov).

**Scale Score**

The scale score earned by the student determines the student's proficiency level. Scores on the science SBA are grouped into four proficiency levels: Advanced, Proficient, Below Proficient, Far Below Proficient. Scores on the science SBA are grouped into four proficiency levels: Advanced, Proficient, Below Proficient, Far Below Proficient. The points earned are converted into a scale score that takes into consideration the fact that some items that make up a standard on the test are more difficult than others. Therefore, a student can earn the same raw score on two standards and end up with two different scale scores. For this reason, you cannot divide the points earned by the points possible for a standard to derive the scale score.

**Skills Performance**

Science is composed of different skills. The chart on the right shows how your student did on these skills.

**Interpretation of Chart**

Scale scores are represented by the diamond (•). For each subject, the chart displays where the proficiency level scores lie within the possible scale score range for each student. Scores earned by students who are below the acceptable level for proficiency are represented by a darker diamond, whereas scores in the non-shaded area are considered proficient.

For example, your student’s scale score of 361 for science is 99. Note that the diamond representing this score falls in the Advanced scale score range. If your student were to score 303, they would fall into the Proficient range. If your student were to score 233, they would fall into the Below Proficient range. If your student were to score 165, they would fall into the Far Below Proficient range.

---

**Reading the Student Report**

**A** Presents student demographics.

**B** Indicates the student’s scale score and proficiency level in science.

In order to be considered proficient, the student must score at or above the Alaska Proficient Scale Score.

**C** Describes the proficiency levels reported in section B. Scores on the science SBA are grouped into four proficiency levels.

**D** Describes the scale scores reported in section B. The scale score earned by the student determines the student’s performance level of advanced, proficient, below proficient, or far below proficient on the science SBA. The points earned are converted into a scale score that takes into consideration the fact that some items that make up a standard on the test are more difficult than others. Therefore, a student can earn the same raw score on two standards and end up with two different scale scores. For this reason, you cannot divide the points earned by the points possible for a standard to derive the scale score.

**Guide to Test Interpretation for the Grade 8 Science SBA for Parents and Students**

Page 2
E. Lists the Performance Standard categories.

F. Lists the total points possible for the Performance Standard categories.

G. Lists the points earned by the student for the Performance Standards on the science SBA. Points earned are not valid for comparisons across grades, and/or standards. The same raw score on two standards usually results in two different scale scores depending on the number of questions and the difficulty of the questions. For this reason, you cannot divide the points earned by the points possible to determine meaningful percentages.

H. Lists the scale score equivalent for points earned.

I. Explains the information found in the probable scale score range chart (J).

J. Graphically illustrates the student’s scale score (∗), the student’s 80% confidence interval for Performance Standards and total test, and the proficiency cut score for the total test.

K. Describes the skills necessary for a student to be proficient, along with the range of scale scores associated with each level.

* This illustration is not based on the current administration.

Question:

In 8th grade science, the maximum overall scale score is 600. However, the four maximum subject/standard scale scores are 600, 600, 535, and 534. How can these four numbers combine into a higher number (600) than two of the four numbers?

Answer:

It is necessary to understand the relationship between raw scores and scale scores to appreciate the seeming anomaly.

*Range:*

Two things, the number of items and the difficulty of the items that make up a standard, determine the range of possible scale scores.

- The longer the test, the wider the range of scale scores.
- The easier the test, the lower the maximum scale score.
For any given person, the raw score for the total test is the sum of the raw scores for the standards, BUT the total scale score is not the sum, nor the average of the standard scale scores.

There is no mathematical relationship between the average of the scale scores for the standards and the average overall scale score.

**Impact of hard and easy items:**
The relationship between raw scores and scale scores is designed to eliminate the effect of taking a hard test or an easy test, or the fact that the items from one standard may be easier than the items from another standard.

- Students would need fewer correct responses on a “harder” standard to achieve the same scale score they would get by having more correct responses on an “easier” standard.

  OR

- Answering 70% of the items correctly on a “harder” standard represents a higher level of ability than answering 70% of the items correctly on an “easier” standard.

The raw score to scale score conversion levels the playing field, removing the impact of harder items or easier items in a given standard.

The total test scale score is not a simple average of the standard scale scores.

- The relationship is much too complex to be described by an average that ignores the number of items in each test and the average difficulty of the items making up that standard.

**Question:**
Is it possible for a student to answer all of the items correctly in a standard and not get the highest possible scale score (600)?

**Answer:**
Yes.

- A perfect score in a standard with easier items will translate into a lower scale score than a perfect score in a standard with harder items.

  - Both maximum scores may be less than the maximum score for the overall test.

    - This is due to the distribution of item difficulties and the number of items.

    - It is easier to answer 11 of 11 items correctly in a single standard than it is to answer 64 of 64 items correctly on the entire test.

    - The scale score for answering all of the items correctly on a standard will necessarily represent less ability than answering all of the items correctly on the overall test.

    - Although the scale score span goes from 100 to 600, it does not mean it is possible to get the highest or lowest scale score on every standard or even the overall test.
